WORK EXPERIENCE

SOFTWARE DEVELOPER
Hearo | Nov 2019 - Present

At Hearo we build applications to allow our users to provide care to people with developmental disabilities remotely. I've played a significant role in:
- Leading development on the company's main mobile application. This included VOIP and push notification features
- Leading initial development of and adding new features to the company's kiosk style desktop application. This also included VOIP features.
- Adding additional features and fixing bugs to the company's web dashboard and API.

LEAD SOFTWARE DEVELOPER
EmergencMe | Jun 2019 – Nov 2019

When I joined EmergencMe, the goal was for the company to begin moving it's development away from overseas contract developers to a local team. The company shut down at the end of 2019 before that could be fully realized. Before the shut down I was responsible for:
- Being the point of contact between the contract developers and the rest of our team. This included working with the overseas team to work out how to best implement feature requests and turn those requests into requirements
- Working with the sales team in doing product demos at in person meetings and trade shows

SOFTWARE DEVELOPER
Mostly Serious | Jan 2018 – Jun 2019

During my time with Mostly Serious I was one of the 3 engineers at the company. My duties normally involved maintenance, bug fixes, and additional features for ongoing projects. as well as leading development on some of the newer projects.

Some of the projects I lead development on included:
- essets.com
- paragon360.com
- ozarkstransportation.org

I also played a major role in some large internal projects including
- Migrating many existing projects from shared servers to a new cloud infrastructure on AWS. This included setting up CI/CD using Bitbucket pipelines and AWS Codedeploy.
- Working with the engineering team to establish consistent code styles as well as upgrading our internal tooling to allow us to take advantage of modern web features
